

To Be Read Into The Record on June 25, 2008

Are we once again, addressing a 21st century challenge with a 20th century solution? Are we, once again, forsaking science for political expediency? Are we, once again, behind the curve?

So it appears!

All of today's science tells us, indeed warns us, to change course before it is too late. As we have been digging the graves of other species we've been digging our own, too.

If we can't get it right on a relatively benign issue, like water levels, how can we expect to solve the really serious problems?

We have an opportunity to make a small difference for the health of the planet and send the message that our environment matters.

With this opportunity comes the ethical responsibility to choose that which will nurture future life.

Plan B+ is the responsible choice.
